Art Unit: 2611

1. Claim 25 is objected to because of the following informalities: the claim should end in a single period. Appropriate correction is required.

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 11, 40-42 and 44-46 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 11 recites a feature that "may" be included, which is indefinite because the system either has the feature or does not (thereby describing two mutually exclusive embodiments depending on the inclusion or exclusion of that feature).

Claims 40-42 and 44-46 have ambiguous scope and their subject matter indefinite because their dependencies seem incorrect. Claim 40 should depend from claim 32, claim 41 from claim 40, claim 42 from claim 41, claim 44 from claim 32, and claims 45 and 46 from claim 11.

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 2, 8 and 9 are rejected under 35 U.S.C. 102(b) as being anticipated by Morimoto.

The system of Morimoto (particularly noting Figs. 1, 4 and 11) involves determining a time delay (shift) occurring in an output signal from terminal 2; converting or interpreting the time delay data into a value α to which a phase shift value is assigned; and applying a correction value to a waveform generator 25 according to the phase shift (note also col. 2 lines 12-16 and lines 50-54; col. 3 lines 30-36; and col. 9 line 53 - col. 10 line 33), thereby meeting claim 1.

As for claim 2, the time shift is done on a line-by-line basis (e.g. col. 2 lines 50-54).

As for claim 8, the phase correction is ultimately used to correct the output waveform of the signal initially applied to input 2.

Regarding claim 9, the phase correction value is applied to the waveform block 25 per each line.

4. Claims 10, 11, 22, 45 and 46 are rejected under 35 U.S.C. 102(b) as being anticipated by Oh (provided by applicant).

The time base corrector of Oh (noting Figs. 2, 4 and 8) stabilizes the chrominance subcarrier wherein the circuit includes a clock generator 33 or 38; a digital phase detector 26 or

27; a digital loop filter 30; a waveform generator 25; and phase correction block arrangement of elements 30-33, thereby meeting claim 10.

As for claim 11, Figs. 4 and 6 show circuit arrangements which generate serial signals from parallel processes.

As for claim 22, digital lop filter 30 (detailed in Fig. 8) includes two different K values in different respective paths.

Regarding claim 45, the output of the phase correction block is applied to waveform generator 25.

As for claim 46, output of either serializer mentioned above is ultimately indirectly coupled to waveform generator 25.

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Applicant is informed that the additional references are also applicable to the rejected claims, as well as Otaki cited by applicant.

6. Claims 3-7, 12-21 and 23-44 appear allowable over the prior art.
